of an external magnetic field (iron, nickel, cobalt...). Paramagnetic: material slightly attracted by a magnetic field and which doesn't retain the magnetic properties when the external field is removed (magnesium, molybdenum, lithium...). Diamagnetic: a material that creates a magnetic field in opposition to an externally applied magnetic field

MAGNETISM and its practical applications

Accordingly, only certain materials (such as iron, cobalt, nickel, and gadolinium) exhibit strong magnetic effects. Such materials are called ferromagnetic, after the Latin word for iron, ferrum. A group of materials made from the alloys of the rare earth elements are also used as strong and permanent magnets (a popular one is neodymium).

Applications of Magnetism | Boundless Physics

Soft ferromagnetic materials are iron and its various alloys with materials like nickel, cobalt, tungsten and aluminium. Ease of magnetization and demagnetization makes them highly suitable for applications involving changing magnetic flux as in electromagnets, electric motors, generators, transformers, inductors, telephone receivers, relays etc.
