curves, it indicates that propeller power at 2,300 RPM is 250, but that the engine is putting out about 380 HP at that same speed. What happened to the missing 130 horse-power? The answer is that the engine isn't generating it. A diesel engine's power at any RPM is controlled by how much fuel is metered into the injectors.

Understanding Engine Performance and Engine - Gerr Marine

HP= (Torque x RPM)/5250. You can measure torque and RPM and you have to calculate the Horsepower (HP) from them and not vice versa. A typical engine performance curve is shown below: Fig.1: Engine Performance Torque Curve. Torque curve (shown in Dark red color) is the graph plotted between torque and RPM of the engine.

The horizontal axis shows engine speed in revolutions per minute (RPM) and the vertical axis indicates power in both kWm and in HP. There are two curves shown and the testing standards are indicated (ISO 3046). Typically these curves are referred to as 'continuous' (the lowest output), and 'intermittent' (the upper curve).

It is interesting to note that the formula also verifies the typical torque bell curve when the torque trails off as rpm increases at the top end. One may consider that engines making torque at a lower rpm tend to work better in marine applications due to the fact that 'most' boats tend to plane in the range of 2,000 - 3,000 rpm.

A smooth curve is drawn between these points and the position of this curve with respect to the base line XY gives an idea about the state of various bearing. For example in this particular case you can easily make out that bearing of units 1 and 2 are too far away from the base line and hence need attention.
