Optical

Access Free Metallic Films and Magnetic...

Metallic magnetic thin films are an active and vibrant area of scientific research that provides the underpinning for many technological advances. Much of this interest is focused on films less than 50 nm thick, which has guided the

Optical properties of metallic films for vertical-cavity ...

We present models for the optical functions of 11 metals used as

Access Free Metallic Films

mirrors and contacts in optoelectronic and optical devices: noble metals (Ag, Au, Cu), aluminum, beryllium, and transition metals (Cr, Ni, Pd, Pt, Ti, W). We used two simple phenomenological models, the Lorentz–Drude (LD) and the Brendel–Bormann (BB), to interpret both

This study presents a
general 3D

nanofabrication
technique, the
focused ion beam

stress induced
deformation process,

Optical

Access Free Metallic Films

which allows a programmable and accurate bidirectional folding

(-70° — $+90^\circ$) of various metal and dielectric thin films.

Using this method, 3D helical optical antennas with different handedness, improved surface smoothness, and tunable geometries

Access Free Metallic Films

are fabricated, and the strong optical rotation effects of single helical antennas are demonstrated.
