Meteorology For Wind Energy An Introduction

This book is intended to give an introduction into the meteorological boundary conditions for power generation from the wind, onshore and offshore. It is to provide reliable meteorological information for the planning and running of this important kind of renewable energy. This includes the derivation of wind laws and wind profile descriptions, especially those above the logarithmic surface layer.

Energy Meteorology is an active field of research interfacing renewable energy and atmospheric physics by providing data and developing new methods for the characterisation of the fluctuating power output from solar and wind energy systems. The Energy Meteorology Group consists of some 30 researchers who are associated with the Energy and Semiconductor Research Laboratory (EHF) of the Institute of Physics, and the Center for Wind Energy Research - ForWind, respectively.

ABSTRACT. This review discusses some of the current issues in wind energy meteorology from the viewpoint of a meteorologist. The focus is on four major subjects: (1) the wind potential, (2) the influence of major terrain inhomogeneities on this wind potential, (3) diurnal wind variations and (4) the impact of wind turbines and wind parks on the flow.

Accurate prediction of near-surface wind based on numerical weather prediction models is essential to promote efficient wind energy harvesting. In this study, the performances of different Boundary Layer (BL) schemes in Weather Research and Forecasting model on the simulation of near-surface wind over complex terrain are investigated. Results indicate that, 1) the observed mean wind speed, its ...

The role of meteorology in the energy sector was the subject of an international conference in Boulder, Colorado, in June. David Richardson, who attended the event for ECMWF, explains why the growth in renewable energy is boosting demand for weather prediction across all timescales. Weather forecasts have long been important to the energy sector.

Description Meteorology. The National Weather Service defines Santa Ana winds as "Strong down slope winds that blow through the mountain passes in southern California. These winds, which can easily exceed 40 miles per hour (64 km/h), are warm and dry and can severely exacerbate brush or forest fires, especially under drought conditions."
