OpenCL™ is a standard for writing parallel programs for heterogeneous systems, much like the NVidia* CUDA* programming language. In the FPGA environment, OpenCL constructs are synthesized into custom logic. An overview of the OpenCL standards will be discussed. You will learn about the platform, execution, memory, and programming models that define the OpenCL specification.

Abstract. OpenCL* is an important new standard for heterogeneous computing. With OpenCL, a software developer can write a single program running on everything: from cell phones to nodes in a supercomputer. To reach its full potential, however, OpenCL needs to deliver more than portability. It needs to deliver "performance portability".
