~~PIC CHAPTER 3 PIC Microcontroller CCP and E CCP Tips & Tricks~~

Introducing The CCP Module This is a multi-purpose module that we can switch between 3 different modes of operation. At each mode of operation, this module can perform a specific task that could be useful for many applications. The Microchip PIC16F877A Chip that we're using has a couple of identical CCP modules CCP1 & CCP2.

~~CCP Modules (Capture/Compare/PWM) | DeepBlue~~

Capture-Compare-Pulse-Width-Module (CCP) is a special module designs for modulation and waveform generation applications. This module basically works on three different modes (capture/compare and PWM odes). The PIC 16F877 chip contains two CCP ports (CCP1 and CCP2). Each of this CCP module contains 16 bit registers which works as

~~Section 14. Compare/Capture/PWM (CCP)~~

The PIC Microcontroller has an inbuilt CCP module and PWM can be easily generated using the inbuilt CCP module. CCP stands for Capture/Compare/PWM. CCP modules are available with a number of PIC Microcontrollers. Most of them have more than one CCP module. Here, I am referring to PIC16F877A that has 2 CCP modules, named CCP1 and CCP2. Each Capture/Compare/PWM (CCP) module contains a 16-bit register which can operate as a: 16-bit Capture Register. 16-bit Compare Register.
