Chloroplasts are dynamic organelles within the plant cell. Movement of entire chloroplasts to maximize light absorption was observed long ago by light microscopy (see textbook, Figure 9.14). Chloroplasts are surrounded by an envelope membrane, which sometimes appears to circulate around the main body of the organelle.

The pH in the cytosol of plant cells is around 7.5, and the homogenate should be buffered at pH 7–8. A buffer should therefore be included and a plethora of different buffers are available. Choose an inexpensive one with a pKa of 7–8 (e.g., 4-morpholinopropane sulfonic acid [MOPS]) and be sure to use enough to counterbalance the acidic vacuolar content.

The upper mature leaves on a plant usually provide photosynthates to the growing shoot tip and young, immature leaves; the lower leaves supply predominantly the root system. Intermediate leaves export in both directions, bypassing the intervening mature leaves. The importance of various sinks may shift during plant development.
