Pollack Cells Gels And The Engines Of Life

Pollack finds the locus of most cell activity and function in the general phase-transition properties of gels. He cites the practical use of phase-transitioning gels in engineering and presents evidence of similar mechanisms at work in the major functions of cells. In phase transitions, "triggering is `razor-edge.'

Cells accumulated around the Org- and 9.8C10-gels, but no foreign body giant cells were observed, indicating good biocompatibility of the hydrogel [30,39]. Fourteen days after implantation, cells had infiltrated into both Org- and 9.8C10-gels; however, more micropores and cell infiltration were seen in Org-gel compared with 9.8C10-gel, which was attributed to the lower crosslinking ratio of ...

Supramolecular gels have been an area of interest in many research fields. They provide a means to understand assembly of nanostructures, and through the use of amino acid- and peptide-based gelators they can give insights into the similar assembly pathways of their more complex structural counterparts. Bio-inspired metal coordination, such as histidine-copper coordination, in the ...
