Principles of aperture and array system design: Including random and adaptive arrays. Steinberg, B. D. Abstract. The book is concerned with two major disciplines in array design: the geometric properties of arrays, which are handled by physical optics, Fourier and Fresnel transforms, and convolution theory, and the relation of array properties to properties of systems within which the array serves as the transducer.

The principles of array antenna design using pattern multiplication of element and array patterns can be used to design and analyse arrays of apertures. Here we assume the apertures are all the same shape and size, and are orientated in the same direction in the x-y plane.

In the case considered, the number of array elements and the spatial aperture of an unequally spaced array are a priori fixed. Thanks to the high flexibility of simulated annealing, the results obtained for a 25-element array over an aperture of 50l improve those reported in the literature.

Principles of Aperture and Array System Design (1976)

For a given aperture (A), the focus length (L) DECREASES as the focal distance (zfoco) DECREASES. The maximum focal distance (zfoco(MAX)) must be inside the near-field No. A => Active aperture. V => Velocity of propagation. Dynamic. Depth Focusing (DDF) The DDF dynamically changes the focal distance as the signal returns to the phased array probe.
