## I Probabilistic Graphical Models

Probabilistic Graphical models (PGMs) are statistical models that encode complex joint multivariate probability distributions using graphs. In other words, PGMs capture conditional independence relationships between interacting random variables. This is beneficial since a lot of knowledge on graphs has been gathered over the years in various domains, especially on separating subsets, cliques and functions on graphs.

## **CS 228 - Probabilistic Graphical Models**

A graphical model or probabilistic graphical model or structured probabilistic model is a probabilistic model for which a graph expresses the conditional dependence structure between random variables. They are commonly used in probability theory, statistics—particularly Bayesian statistics—and machine learning. An example of a graphical model. Each arrow indicates a dependency. In this example: D depends on A, B, and C; and C depends on B and D; whereas A and B are each independent.

Probabilistic graphical models (PGMs) are a rich framework for encoding probability distributions over complex domains: joint (multivariate) distributions over large numbers of random variables that interact with each other. These representations sit at the intersection of statistics and computer science, relying on concepts from probability theory, graph algorithms, machine learning, and more.

Probabilistic graphical models are probabilistic models whose graphical components denote conditional independence structures between random variables. The probabilistic framework makes it possible to deal with data uncertainty while the conditional independence assumption helps process high dimensional and complex data.
