Page 40 of 160 "Using POSIX Threads." The code creates two threads, both of which execut e the routine func(). The main thread then waits for both the child threads to complete their work. Both threads will attempt to increment the variable counter. We can compile this code with GNU gcc and then use Helgrind, which is part of the Valgrind1 suite, to identify the data race.

POSIX Threads provide multiple flows of execution within a process. The threads have their own stacks but share the global data and the heap. So the global variables are visible to multiple threads. Also, the threads need to synchronize their actions so that they jointly realize the overall objectives of the process they belong to.
