ordination of relays with appropriate relay settings is to be done. Relay settings are done in such a way that proper co-ordination is achieved along various series network. Relay co-ordination can be done by selecting proper plug setting and time multiplication setting of the relay, considering maximum fault current at the relay location.

## Power System Protection With Relay Co-Ordination

The basic rules for correct relay co-ordination can generally be stated as follows: RULE #1. Whenever possible, use relays with the same operating characteristic in series with each other. RULE #2

breakers on the primaries of transformers: A. Pickup is typically chosen at approximately 140% of nominal transformer current or higher if coordination considerations dictate that. Values up to 600% are allowed by the NEC, depending upon the system parameters

## OVERCURRENT COORDINATION GUIDELINES FOR INDUSTRIAL POWER ...

For an overcurrent protective relay, the ' pickup ' value is the minimum value of current that causes the relay to start timing and ultimately close its contacts. Delta-Wye Transformers Delta-Wye transformers are of great interest when doing a protection coordination study.

Power System Protection, 8.2 Relay Coordination 1MRS757285 6 margin must be maintained to secure the selectivity. When inverse time relays are used instead of definite time relays, longer grading times must generally be used, because, among other things, the effect of the in-accuracy of the current measurement on the operating time must be observed.

## PES/IAS Joint Chapter

Relay coordination studies are performed to ensure safety operation of the system and to avoid the nuisance tripping. The cause for this nuisance tripping is changing the protective devices and their settings at the time of maintenance without performing proper analysis. In relay protection coordination services examining the coordination between the protective devices with the help of time current characteristics (TCC) from the lower stream to the upper stream and
