Physiological, Biochemical and Other Changes Accompanying Seed Germination. Physiology of Seed Germination: All the viable seeds which have overcome dormancy (if any) either naturally or artificially will readily germinate under suitable environmental conditions necessary for seed germination i.e., water, O₂, temperature and in some cases light. Such seeds which just wait for suitable environmental conditions to germinate are said to be ' quiescent ' .

Physiology of Seed Germination - Biology Discussion

Description Seed Physiology, Volume 2, Germination and Reserve Mobilization, addresses some of the major unanswered questions about seed dormancy, germination, and post-germination development of the seedling.

Seed Physiology Germination And Reserve Mobilization ...

Oxygen is essential for seed germination. The initial phase of seed germination may involve anaerobic respiration but immediately it shifts to aerobic state. In a seed where testa is retained the oxygen consumption is much higher than in the seeds where testa has been removed.

Physiology of Seed Germination - Biology Discussion

Description. Seed Physiology, Volume 2, Germination and Reserve Mobilization, addresses some of the major unanswered questions about seed dormancy, germination, and post-germination development of the seedling. The book contains seven chapters and begins with two studies on dormancy—one on the structural constraints to germination and another on metabolic barriers preventing germination.

Germination and Reserve Mobilization - 1st Edition

Germination: Seeds of various cultivated species are able to germinate a few days after ovule fertilization. In this case, germination refers to protrusion of the primary root, not the formation of a normal seedling because histo-differentiation has not been completed and reserve accumulation is still incipient at this phase.

The germination of seeds in a particular situation and season is determined by the interaction between the dormancy releasing factors, which influence on the termination of dormancy or initiation...

He displayed an awareness of seed physiology that would not disgrace the pages of books written two millenia after his death. Dormancy, reserve deposition, the effects of environmental factors on seed development and germination, seed longevity and priming — topics which are in the forefront of modern research — all received his comments (see Evenari, 1984).
