Real time system means that the system is subjected to real time, i.e., response should be guaranteed within a specified timing constraint or system should meet the

specified deadline. For example: flight control system, real time monitors etc. Types of real time systems based on timing constraints: Hard real time system –

Real Time Systems - GeeksforGeeks
Real-time computing, or reactive computing is the computer science term

for hardware and software systems subject to a "real-time constraint", for example from event to system response. Real-time programs must guarantee response within specified time constraints, often referred to as "deadlines". Real-time responses are often understood to be in the order of milliseconds, and sometimes

microseconds. A system not specified as operating in real time cannot usually guarantee a response within any t

Game Systems... In the context of this article, the term real-time software means software that is engineered to comply with real-time constraints. In other contexts, the term real-time software is occasionally used to describe software that is interactive with a human user. Real-time stock quotes, for

example, might be delivered to your computer screen as soon as you type your inquiry.

Developing Real-Time Software with Java SE APIs: Part 1

Software engineering treats the approach to developing software as a formal process

much like that found in traditional engineering. Software engineers begin by analyzing user needs. They design software, deploy, test it for quality and maintain it. They instruct computer programmers how to write the code they need.
