Solving Problems With a Distance-Rate-Time Formula

Read PDF Solving Distance Rate Time Problems

We use the rate-time-distance formula to write the distance D traveled by John and Peter (same distance D) $D = 3x$ and $D = 2(x + 20)$ The first equation can be solved for x to give. $x = D / 3$. Substitute x by $D / 3$ into the second equation. $D = 2(D/3 + 20)$ Solve for D to obtain $D = 120$ miles. Problem 8.

Read PDF Solving Distance Rate Time Problems

The formula to find the time when distance and rate are given is. $\text{Time} = \text{Distance} / \text{Rate}$. Time taken to cover the distance of 160 miles is $\text{Time} = 160 / 40$. $\text{Time} = 4$ hours. So, the person will take 4 hours to cover 160 miles distance at the rate of 40 miles per hour. Problem 2 : A person travels at a rate of 60 kms per hour.

"how long" one moving object traveling until it meets up with the second moving object. It uses $d = rt$ (distance equals rate times time).

Distance Word Problems (solutions, examples, videos)

To solve for distance use the formula for

Read PDF Solving Distance Rate Time Problems

distance $d = st$, or distance equals speed times time. distance = speed x time. Rate and speed are similar since they both represent some distance per unit time like miles per hour or kilometers per hour. If rate r is the same as speed s , $r = s = d/t$. You can use the equivalent formula $d = rt$ which means distance equals rate times
