This book covers a huge variety of topics in atomic molecular and optical physics. As can be expected from the range of topics, they are not covered in much depth. Each chapter is written by a different author, and they all seem to be experts in their topics, but the quality of the chapters does vary quite a bit.

Part of the Springer Handbooksbook series (SHB) Abstract. The availability of coherent light sources (i.e., lasers) has revolutionized atomic, molecular, and optical science. Since its invention in 1960, the laser has become the basic tool for atomic and molecular spectroscopy and for elucidating fundamental properties of optics and optical interactions with matter.

Abstract. This chapter outlines the theory of atomic photoionization, and the dynamics of the photon-atom collision process. Those kinds of electron correlation that are most important in photoionization are emphasized, although many qualitative features can be understood within a central field model. The particle-hole type of electron correlations are discussed, as they are by far the most important for describing the single photoionization of atoms near ionization thresholds.
