Stepper motors are suitable for applications where compact and robust solutions are required. They develop their maximum torque at stand-still which makes them naturally suitable to hold a position. The external commutation ensures that the

speed is perfectly constant even if the load varies.

Stepper motor basics

A stepper motor is a type of brushless DC electric motor that moves in precise angles, called steps, by converting a series of electrical pulses

into rotational motion. They will not produce continuous motion from a continuous input voltage, and it will stay at a particular position as long as the power is "on".

A stepper motor, also known as step motor or stepping motor, is a brushless DC electric motor that divides a full rotation into a number of equal steps. The motor's position can then be commanded to move and hold at one of these steps without any position sensor for feedback, as long

as the motor is carefully sized to the application in respect to torque and speed. Switched reluctance motors are very large stepping motors with a reduced pole count, and generally are closed-loop commutated.

A Stepper Motor or a step motor is a brushless, synchronous motor which divides a full rotation into a number of steps. Unlike a brushless DC motor which rotates continuously when a fixed DC voltage is applied to it, a step motor rotates in discrete step angles.
