Corals can be found throughout the oceans, from deep, cold waters to shallow, tropical waters. Shallow coral reefs have optimal growth rates in warm water ranging from 70–85° F (21–29° C). Coral reefs can be found at depths exceeding 91 m (300 ft), but reef-building corals generally grow best at depths shallower than 70 m (230 ft).

Apart from depth, onshore–offshore and nutrient gradients as well as substrate types determine the geomorphology, community structure and diversity of reefs. In *The Biology of Coral Reefs*, most systems are from relatively oligotrophic reef systems and do not fully cover the specific problems of turbid reef systems. However, despite these two minor caveats, this book provides a good overview of the biology and morphology of coral reefs, and is highly recommended as a textbook for classes in ...

Coral reefs are built through the deposition of calcium carbonate (limestone) by corals over very long periods of time. Corals are invertebrate animals from the phylum Cnidaria which also contains jellyfish and anemones. Reef building corals are generally very small but large colonies of corals can over time produce vast areas of limestone.
