Abstract: The finite-element method (FEM) has been applied as a powerful numerical method to the study of electric contacts. In this work, the boundary element method (BEM), is introduced into the study of contacts, and the constriction resistance of conducting spots is computed by the method. The constriction resistance of circular spot is computed, and by comparing the computed value with the exact solution presented by Holm (1979), the high accuracy of the calculated value by the BEM is ...
