Reliability and maintainability are important measures of the effectiveness of systems or products. One way to define the difference between reliability and maintainability is that while reliability is the probability that a failure will not occur in a particular time, maintainability is the probability that required maintenance will be successfully completed in a given time period.

**Maintainability - an overview | ScienceDirect Topics**

Reliability and maintainability management is the management of failure. By using specific approaches and tools, one can obtain optimized, cost-effective solutions to the design, assembly and use of a product. R eliability is the probability of a product successfully functioning as expected for a specific duration within a specified environment. Figure 1 shows the four key elements to reliability: function, probability of success, duration and environment.
