In sound waves, also known as acoustic waves, the local oscillations always move in the same direction as the wave. Waves like this are called longitudinal waves. Unlike acoustic waves, radio waves or guitar-string vibrations are transverse waves; that is, the local oscillations are always perpendicular to the wave motion. An example of a transverse wave is shown below, representing the waves that can be set up in, say, a skipping rope or a washing line.

Nature And Characteristics of Sound Waves | Smart Science Pro

A sound wave is the pattern of disturbance caused by the energy traveling away from the source of the sound. Sound waves are longitudinal waves. This means that the propagation of vibration of particles is parallel to the direction of the energy wave propagation. When the atoms are set in vibration they move back and forth.

The nature of the sound waves The sound waves propagate through media as spheres. The sound waves are mechanical longitudinal waves which need a medium to propagate, They propagate through media as the spheres whose centre is the source of the sound, and they consist of the compressions and the rarefactions.

The Theory of Sound | Nature
Frequency in a sound wave refers to the rate of the vibration of the sound travelling through the air. This parameter decides whether a sound is perceived as high pitched or low pitched. In sound, the frequency is also known as Pitch. The frequency of the vibrating source of sound is calculated in cycles per second.
