inverter is a component or device that inverts the state or logic level of a signal to the opposite logic level. Thus, if a LOW signal is fed into an inverter, it flips it to a HIGH signal. If a HIGH signal is fed into an inverter, it flips it to a LOW signal. So an inverter changes the logic state to the opposite logic of what is fed into it.

In the transistor inverter, the output is taken at a voltage divider between the transistor and the positive voltage. When the push button input is open, the resistance across the collector-emitter junction is very high. The high resistance at the transistor means the voltage at the output is high and therefore the LED is lit.
