Carbon dioxide and its ability to absorb and re-radiate heat is key in understanding climate change. Students look at sources and sinks of carbon dioxide, allowing them to understand that climate change is almost certainly caused mostly by humans. The changes in the climate are already causing significant harm to both physical and biological systems.

At one extreme, climate change can result in extended periods of heat and drought; at the other, extensive glaciation. Currently, our planet's global surface temperature is rising. This change is linked to human activities that increase the amount of greenhouse gases (e.g., carbon dioxide and methane) in the atmosphere.

*Climate | National Oceanic and Atmospheric Administration*

What do we mean by climate change? Climate change means any significant change in climate, like temperature or rainfall, over a 30 year period or more. If the climate is changing, then the 30 year average temperature, or rainfall, or number of sunny days, is changing. It's easy to mix up climate and weather.

*About Climate Change – Metlink | Weather & Climate ...*

Climate change has also been connected with other damaging weather events such as more frequent and more intense hurricanes, floods, downpours, and winter storms. ?In polar regions, the warming global temperatures associated with climate change have meant ice sheets and glaciers are melting at an accelerated rate from season to season
