You Don't Know JS: Scope & Closures Chapter 1: What is Scope? One of the most fundamental paradigms of nearly all programming languages is the ability to store values in variables, and later retrieve or modify those values. In fact, the ability to store values and pull values out of variables is what gives a program state.

The only way the JS engine could know, at the line where the error is thrown, that the next statement would declare a block-scoped variable of the same name (greeting) is if the JS engine had already processed this code in an earlier pass, and already set up all the scopes and their variable associations. This processing of scopes and declarations can only accurately be accomplished by parsing the program before execution.

This design approach can be quite useful, and certainly can make full use of the “dynamic” nature of JavaScript variables to take on values of different types as needed. On the other hand, if you don't take careful precautions, variables existing across the entirety of a scope can lead to some unexpected pit-falls.
